Abstract: As a result of the emergence of E-Commerce, e-marketing mix has been widely adopted by most businesses and companies. Currently, the tools of e-marketing mix are provided by the company web site so that the customers can decide whether the company portfolio of products and/or services suits their needs. If we can understand the psychological factors of customer behavior, businesses can know which customers are suitable. This paper presents the relationship between e-marketing mix of particular businesses and psychological factors of customer behavior in order to provide an easier way for both businesses and customers to find their target needs.

Keywords: Consumer Psychological factors, E-Marketing Mix, Internet Marketing

I. Introduction

As a result of the increased utility and bandwidth of Internet communications, the usage of web browsers has increased dramatically. Many users make use of browsers to get different types of information in different media such as text, graphic, animation, audio and video. Hundreds of businesses have exploited this great opportunity to create their own web sites that allow customers to purchase products directly from their browsers. Most commercial companies believe that they can generate a large amount of profit from the web.

Although many web businesses terminated operations or ceased to exist from April 2000 to December 2001, those e-retailers developed and introduced new internet-based marketing techniques (e-marketing), which have been widely considered in the formation of current marketing strategy.

Kalyanam & McIntyre (2002) identified more than 30 e-marketing tools in their review of: popular business press, research reports from industry, textbooks and the academic literature for e-marketing tools.

Before the electronic age, E. Jerome McCarthy (1960) introduced the 4Ps (product, price, place and promotion) standardization of the marketing mix as a core unifying construct. Later on, van Waterschoot and Van den Bulte (1992) pointed out that the components of "communication" address "barriers to wanting", whereas the sales promotion

function addresses "barriers to acting". They observed that "triggers to customer action" seem necessary in certain situations to induce the exchange. Hence, they termed sales promotion a "situational" function. On the basis of these distinctions, the marketing mix can be reclassified into the "basic mix" and the "situational mix". In addition, since the sales promotion mix can apply across the full spectrum of the basic mix (the rest of the traditional marketing mix), it is considered by van Waterschoot and Van den Bulte to be overlapping. The concepts developed by van Waterschoot and Van den Bulte (1992) can be summarized in the form of the following axioms:

Axiom 1: Marketing functions are the appropriate properties for the classification of marketing tools.

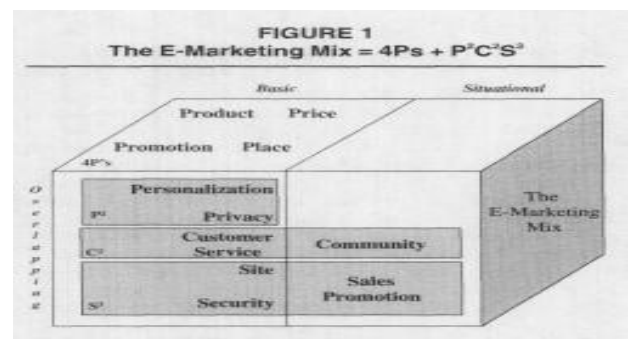

Axiom 2: Some functions are essential and others are situational in nature.

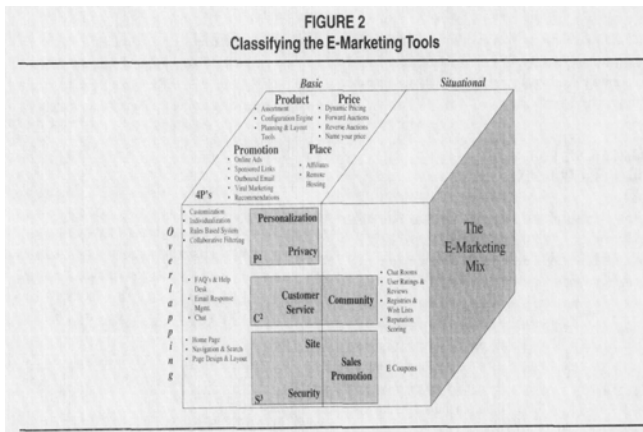

Axiom 3: Some functions have a moderating effect across other marketing functions and are called overlapping functions.

Axiom 4: Functions are accomplished by marketing tools.

Axiom 5: A tool can serve one or several functions.

Based on the above axioms, Kalyanam & McIntyre (2002) created a new E-marketing mix model as illustrated in Figure 1 and mapped the marketing tools and the terms in Table 1 to the new e-marketing mix model, as illustrated in Figure 2.

In the following tables (Tables 1A – 1D), four individual business web sites (randomly chosen) from each of the four types of businesses based on Sam K. M. & Chatwin C. R. (2005): Apparel, I.T. item, Jewellery and Car, are analyzed in terms of the e-marketing mix model from Kalyanam & McIntyre (2002).

According to the above comparisons, there are different e-marketing strategies used by different business web sites in a particular industry. Why are there different e-marketing strategies from different business web sites in a particular industry? It is due to the fact that their target customers are different. Figure 3 illustrates different requirements from customers and businesses:

Figure 3: Different Requirements from Customers and Businesses

Services can be provided such that businesses can get only those target customers (relating to the e-marketing mix of a particular business) and at the same time customers can get their preferable products (relating to the psychological factors of customers). In this way, it is beneficial to both parties.

II. Psychological Factors of Customer Behavior

Based on the psychological factors from Sam K. M. & Chatwin C. R. (2005) of customer behavior, the following facts have been discovered:

1. Consumers have different psychological factors for different types of products
2. In addition to the psychological factors specific to product, it is necessary to consider the psychological factors specific to the web site (online business) as a result of the emergence of e-marketing.

According to (Retailers' Search Engines Boost Online Sales,

http://www.realseo.com/archives/cat_search_engines_news.html), there is a 40% increase in the total number of consumers who visited a retail website's search engine made an online purchase from 2003 to 2004. It shows that search engine has become more important. Online customers can enter search criteria, namely; budget, product features, brand name, portability and quality rating, to refine the product list displayed on screen (ref: http://www.spec-direct.com/Case_Studies.asp?page_id=17). Each of the above criteria is associated with a particular psychological factor of customer behaviour (Point 1 above) as shown in figure 4:

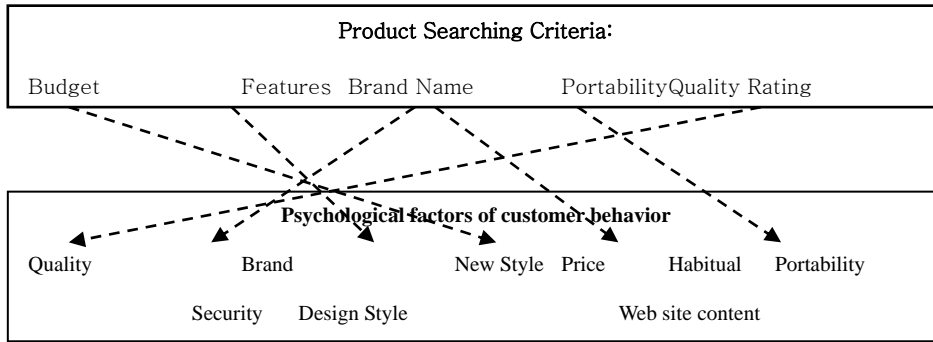

Figure 4: Relationship between Product searching criteria and customer psychological factors

III. E-Marketing Mix

E-marketing mix, when compared with the traditional marketing mix, should be designed in such a way that can reflect the current situation of E-commerce. The e-marketing

mix model designed by Kirithi Kalyanam & Shelby McIntyre (2002) can fully reflect the current situation by identifying basic and overlapping functions and mapping e-marketing tools to those functions. By integrating this e-marketing mix model with the diagram shown above, the following result is achieved, see figure 5:

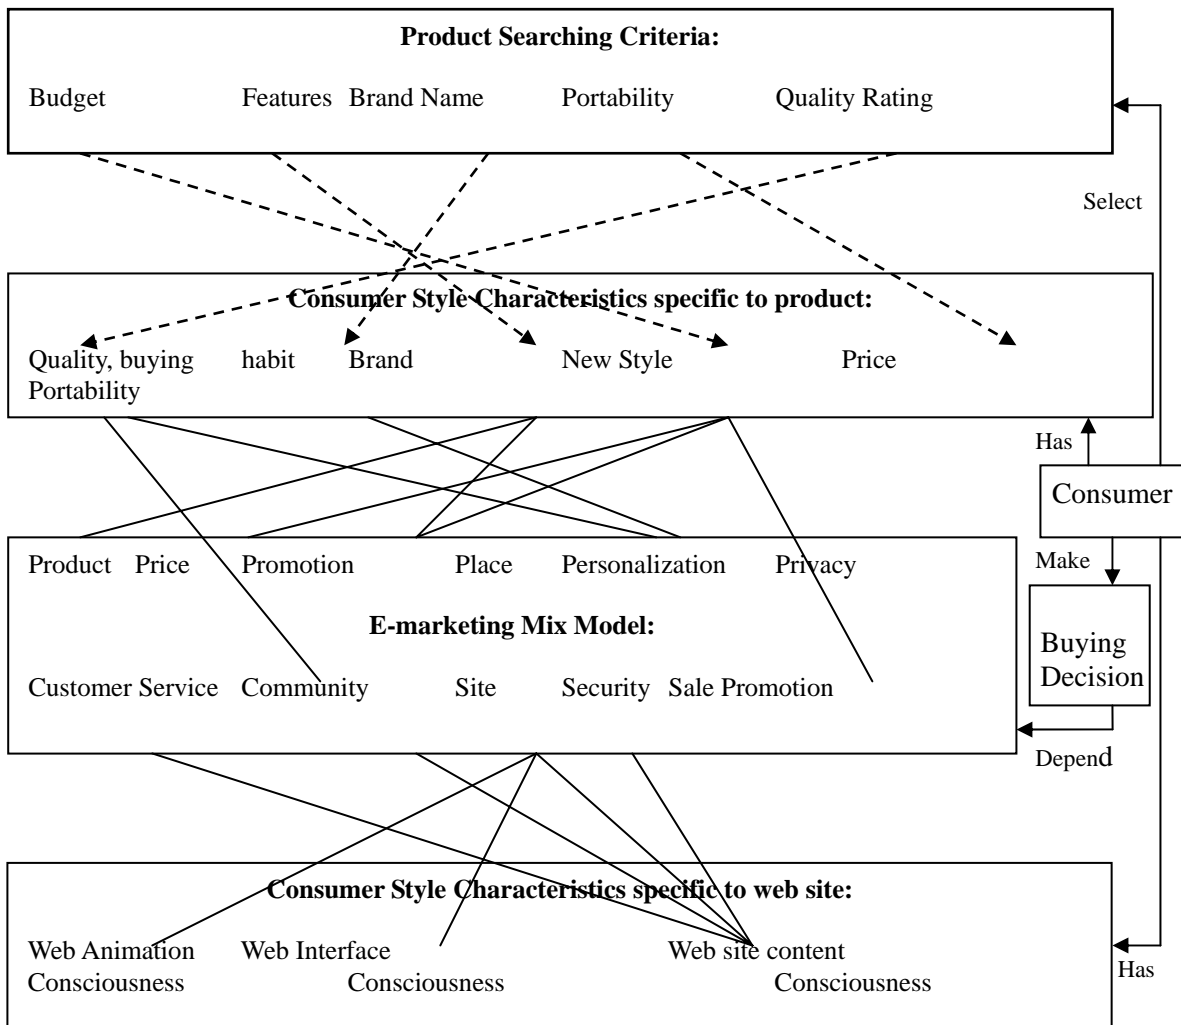

Figure 5: Relationship between E-marketing mix model and Internet Consumers' Decision-Making Styles

Relationship of E-marketing mix model & psychological factors specific to products

If customers demand new style products, they may prefer those web sites, which can offer customisation, allowing them to tailor-make their own products. In addition, they may also want those online businesses which frequently promote some new items on their web sites.

If the customers demand is for low price products, they may select those online businesses which can provide lower prices or e-coupon, or advertise sales promotions on their web sites.

If customers are getting used to particular brands or products, they may prefer those online businesses which can provide personalized services to them so that updated information about particular brands can be obtained easily.

If customers have a habit of buying the same high-quality products, they will be concerned about the user rating of these products and also the personalized services about the history of their purchasing records.

Relationship of E-marketing mix model & psychological factors specific to web site

If customers are annoyed by the effect of web animation and prefer a good design interface, only those web sites with less animation effects and a good user interface (e.g. list box) will be suitable for them.

If consumers make a high demand on the services (including searching, communication, security) and product information, those web sites which can provide: a strong searching mechanism, a good communication tool such as email facility, chat-room service, and a high security standard such as 128-bit encryption standard and detailed

product features - will be most suitable for them.

IV. Conclusion

By integrating the E-marketing mix model of a particular business with psychological factors of customer behavior, the target customers can easily be found. If only the target customers are allowed to enter the business web site and those visitors who are not their target customers are filtered out, it can reduce the workload on the business web site. Furthermore, when more target customers are directed to a particular business web site, the business can generate more profits. One of the future enhancements of this paper is to develop an intelligent agent to provide convenience to customers as well as attracting more potential customers to business web sites based on the corresponding e-marketing mix of particular business.
